

Where churn concentrates — and what to test next

Evidence from the supplied 10,000-record bank customer dataset | Historical associations, not proven causes

10,000

CUSTOMERS IN FILE

20.4%

HISTORICAL EXIT RATE

2,038

RECORDED EXITS

THREE STRONG, CAMPAIGN-RELEVANT SIGNALS

Observed churn rate; segment denominators shown below.

THREE ACTIONS FOR A CONTROLLED RETENTION PILOT

Test against a holdout; scale only on measured uplift.

1 RE-ENGAGE WITH PERMISSION

Pilot a needs-based check-in for customers whose activity is low. Make outreach useful and opt-in; remove friction to everyday account use.

Measure: 90-day retained-customer uplift vs randomized holdout; monitor opt-outs and complaints.

2 REVIEW PRODUCT FIT

Map service issues and customer needs across one-, two- and 3+ product journeys. Offer a suitability review or support—not a blanket cross-sell.

Measure: retention uplift by product cohort, incremental margin and service outcomes.

3 INVESTIGATE GERMANY

Run local customer interviews and journey reviews (onboarding, service, fees, competition). Pilot the strongest locally validated fix before wider rollout.

Measure: Germany pilot vs control; track exits and customer experience.

IMPORTANT LIMITS | Complaint status is excluded: 99.5% of complaint-flagged records exited, a near-direct label match that may be post-outcome/leakage. Age 50-59 also shows elevated churn (56.0%; n=869) but is sensitive and not proposed for campaign targeting.

No event dates or campaign outcomes are supplied: this file cannot establish causation, current risk, or expected churn reduction. Validate feature timing; use randomized pilots and report percentage-point lift before scaling.
